Abstract

The basic objective of the present research is to examine the effect of Customer orientation and HR factors like leadership, emotional intelligence and self-efficacy on satisfaction and effectiveness. This study also explored mediating role of satisfaction as well. For this reason, quantitative approach and cross-sectional research design is adopted. The data was gathered using simple random sampling from the employees of banks in Pakistan. The usable response of the study was 208. This study used process Macro, SPSS for the analysis of the collected data. The results of the study supported the claim that self-efficacy, emotional intelligence, leadership and customer orientation have significant effect on satisfaction. Moreover, satisfaction has positive impact on effectiveness as well. Findings of present study also supported mediating role of satisfaction as well. This study is among pioneering researches that discussed mediating role of satisfaction among customer orientation, HR factors and effectiveness in context of employees in Banking sector.

Keywords: Emotional intelligence, HR factors, team effectiveness, satisfaction, customer orientation.

Introduction

Employees in banks develop teams that offers flexibility to reconfigure and compose the membership in order to align competence of the employees according to demands (Frost & Duan, 2020). In every aspect of life, team has become one of the key building blocks including in context of organizations. Within organization, teamwork creates care for each other. If there is lack of team work, it will make team vulnerable. Therefore, teamwork is the top priority along its improvement with the passage of time. Team interventions can play key role to improve team effectiveness. Moreover, team effectiveness is important to improve performance of the organizations (Shuffler, Diazgranados, Maynard, & Salas, 2018).

The leader of the team is very important in order to make a team atmosphere positive. It has main role to play to establish communication and cohesion within the team (Mach, Ferreira, &

Online ISSN: 3006-8886
Print ISSN: 3006-8878

Abrantes, 2022). Moreover, effectiveness of the organizational team is key driver of the functioning of the team. In order to make a team effective, the leaders and team members must sit together to develop tools and mechanism that can help organization in developing an effective team and adopt the actions that can enhance effectiveness of the team as well (Leo, García-Calvo, González-Ponce, Pulido, & Fransen, 2019).

Study Jekauc, Fritsch, and Latinjak (2021) has mentioned that employee performance can be declined because of emotional factors. These factors are dependent upon their level of intensity, occurrence time, and content having impact on the performance. The capacity of the sports team player regarding the emotions and to manage them is the way to maximize the performance in sports. Sometimes it is considered as basic factor of success in context of sports. Past studies have pointed that emotions is one of the key factor that have impact on the performance (Campo et al., 2019). The success and productivity of the individual can be increased through development of emotional intelligence. There are a number of different elements of emotional intelligence that impacts the outcome and process of this construct. These elements are important to minimize the stress of the individual. On the other hand, harmony among the members of team along with continuity and stability is positively affected. In the end, spirituality and love are also strongly affected by it (Serrat & Serrat, 2017).

Customer orientation is an essential marketing strategy that enables organizations to understand, anticipate, and respond effectively to customers' current and future needs (Castaldo, Mantovani, & Penco, 2026). By prioritizing customer interests, organizations can develop products and services that deliver superior customer value and strengthen market relationships. It also encourages firms to collect, analyze, and utilize customer information to improve marketing decisions and responsiveness. A strong customer-oriented approach contributes to customer satisfaction, loyalty, and retention by ensuring that organizational offerings remain aligned with customer expectations (Verma, 2023). Furthermore, customer orientation provides a competitive advantage and supports improved organizational performance through stronger customer relationships, increased market share, and profitability.

The role of ethics is very important for the organizations (Salimi, 2020). Same is the importance of this factor in the management of organization. In this regard, leaders of the organization are given a lot of importance because of their role in athletes. Leaders of the organization can influence the behaviour of the team members. The expectations related to behaviour and the consequences linked with social environment impact the followers. The perspective of social learning posits that similar behaviour will be performed by the followers which is performed by the leaders (Farh & Chen, 2018). The honesty, integrity and trust of the leaders is strengthened as a result of ethical leadership.

The construct of self-efficacy is studied by different authors as the performance is also dependent upon the factor of self-efficacy. It is one of the aspects regarding knowledge in terms of self-knowledge that impacts the everyday life. The individuals are effected by the self-efficacy in terms of their actions towards the goals achievement (Gayathri & Karthikeyan, 2016). It is key for organizations that they improve the self-efficacy of the employees as it has impact on the effectiveness of the employees. In order to motivate the employees regarding goal achievement, self-efficacy plays very important role. The performance of the employees will be improved who

Online ISSN: 3006-8886
Print ISSN: 3006-8878

have high level of self-efficacy. Also, such person can be a role model as he or she can provide proper guidance to the employees and team members (Khan, Khan, Moin, & Pitafi, 2021).

Satisfaction is the term that reflects fulfilment of wants, needs, desires and happiness during work (Lavy & Bocker, 2018). Happiness of the employee is measured from a number of different perspectives. This factor impacts the morale, goal accomplishment and motivation of the employees in the workplace. Satisfaction reflects the contentment of the employee with the organization in terms of their responsibilities and duties. It is the sense of success and achievement felt by the employees during the work routine on daily basis. Thus, satisfaction at the workplace is key to assess the work attitude along with measurement of performance of individuals and organizations. Satisfaction factor impacts the effectiveness of the job as well. In the context of team working, it is very important to focus on the employee-employer relationship so they can remain satisfied (Taheri, Miah, & Kamaruzzaman, 2020). So, this research was designed to examine the effect of factors like leadership, customer orientation, self-efficacy, and emotional intelligence on satisfaction and effectiveness.

Literature Review

Relationship between Satisfaction and Team Effectiveness

In literature team effectiveness is defined as effective team performance; the potential of a team to achieve its goals during a certain period of time (Cooke, Hilton, & Council, 2015). Effectiveness of the team is the quality that has impact on the performance of the team. It enhances the satisfaction of the team members. Such person is willing to work extra so they can achieve organizational goals and to improve the team outcomes. The effectiveness of the team is determined through the output of the team. It is the consequence of the effort of each team member and enhances the chances to complete tasks effectively. The goals can be achieved effectively and quickly by the effective teams (M. Rusdi & Wibowo, 2022). The team members and leaders of the effective team try to manage and create relationships that are well-balanced among members of the team so they can enhance engagement and commitment.

Researchers have defined satisfaction as “a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experiences” (Cheng & Yi, 2018). It is one of the key concepts in terms of behaviour. It is one of the key psychological indicators of management of organization and business. Since the beginning of management science, researchers have paid attention to the concept of satisfaction. With the passage of time this concept and its definitions have evolved in terms of different categories such as reference structure, difference and comprehensiveness. Thus, on the basis of availability of resources, satisfaction in literature is defined as the sample’s emotional response to their work, namely, their subjective views and attitudes toward their work content, results, and rewards (Salas-Vallina, Alegre, & Guerrero, 2018).

Researchers mentioned that satisfaction is key factor of the effectiveness of the team as self-efficacy of the members of the teams are affected by it. The abilities of the person to perform tasks is increased that impact level of efforts. The satisfaction of individual is dependent on the level of effort that an individual put to perform the tasks. The team members are willing to be vulnerable when they trust other team members. In this situation team effectiveness is positively affected by satisfaction level (El-Hosany, 2017). Study by Weaver Jr (2017) showed that there is

Online ISSN: 3006-8886
Print ISSN: 3006-8878

positive effect of job satisfaction ion the effectiveness of the team. Moreover, findings of S. DeOrtentiis, K. Summers, P. Ammeter, Douglas, and R. Ferris (2013) revealed that satisfaction is key predictor of team effectiveness when goals are shared. Similarly, satisfaction has the ability to improve team effectiveness (Fung, 2014).

H1: Satisfaction has significant effect on the effectiveness of the team.

Emotional Intelligence: Relationship with Satisfaction

Literature as termed emotional intelligence and emotional quotient as the similar ones as they both examine the emotions and emotional feelings of the individuals. Studies have defined emotional intelligence as "the ability to perceive and express emotion, assimilate emotion in thought, understand and reason with emotion and regulate emotion in the self and others" (Kopp, Reichert, & Jekauc, 2021). The base of emotional intelligence is in a term that is used to share, understand, and regulate the feelings of others. It also deals with the recovery and withstanding in terms of recovery from the difficult situation.

The emotional intelligence has positive relationship with different factors like organizational commitment, absenteeism, job stress and performance. According to studies individuals with high level of emotional intelligence have emotions that are matured. On the other hand, individuals with low level of emotional intelligence often face issues related to stress. There are four different factors of emotional intelligence namely regulation of emotions, use of emotions, other emotions appraisal and self-emotions appraisal (Navas & Vijayakumar, 2018). Scholars have studied emotional intelligence with aspect of sports in terms of physical activity and health. Competition in the context of sports is characterized by the emotional demands of the sports players. The performance of the employees is dependent upon different factors including the emotions to handle competitors, fans, referees, trainers and teammates (Acebes-Sánchez, Blanco-García, Diez-Vega, Mon-López, & Rodriguez-Romo, 2021).

The ability to regulate the emotions has positive relationship with satisfaction of the employees as person with high level of emotional intelligence have more ability to control emotions. Such person can easily support the organizational support that has positive effect on satisfaction as well. Likewise Jung and Yoon (2016); (Sabahi & Dashti, 2016) also showed in their findings that the person who utilize emotions in a positive way are more satisfied person (Sabahi & Dashti, 2016). The results of Naseem (2018) concluded that the employees with higher level of emotional intelligence are tend to be more satisfied ones.

H2: Emotional intelligence has significant relationship with satisfaction.

H3: satisfaction mediates the relationship between emotional intelligence and team effectiveness.

Customer Orientation: Relationship with Satisfaction

In the context of marketing, customer orientation is a critical aspect of organizational success. According to Tuominen, Reijonen, Nagy, Buratti, and Laukkanen (2023), customer orientation refers to the organizational emphasis on understanding and addressing customer needs and preferences. It involves collecting and utilizing customer information, developing appropriate strategies, and responding effectively to customer expectations. Moreover, customer orientation en-

Online ISSN: 3006-8886
Print ISSN: 3006-8878

courages organizations to prioritize customer interests and continuously improve the value offered to customers. According to Ahmad and Ahmed (2020), customer orientation is developed through customer sensing and customer responsiveness. Customer sensing enables organizations to identify changing customer preferences, whereas responsiveness allows them to develop suitable products and services to meet those requirements.

Customer orientation is achieved through continuous interaction with customers and the effective utilization of customer-related information. It enables organizations to anticipate future demands, improve service quality, and develop stronger customer relationships. Furthermore, customer orientation facilitates organizational performance by helping firms adjust their offerings according to changing market requirements (Bekata & Kero, 2024). Therefore, customer orientation has become essential for organizations operating in competitive environments. Customer orientation also improves customer relationship management through employee training and customer information processing. Consequently, customer orientation contributes to customer satisfaction, loyalty, retention, and organizational profitability (Zhao, 2022).

H4: customer orientation has significant effect on Satisfaction.

H5: Satisfaction mediates the relationship between customer orientation and effectiveness.

Ethical Leadership: Relationship with Satisfaction

Leadership in literature is defined as “the process of being perceived by others as a leader” (Riasudeen & Singh, 2021). Additionally, ethical leadership in studies is defined as “the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making” (Keck, Giessner, Van Quaquebeke, & Kruijff, 2020). Ethical leadership has main role to play in order to shape the behavior of individuals. Moreover, to drive the practices of the organizations, moral ethics play a very important role. Important guidelines regarding member of organizations are developed through leadership ethics thus they are encouraged to follow the moral cues. The leaders have the influence over the behaviour of followers on the basis of ethics (White & Rezania, 2019).

The productivity of the employees is accelerated because of ethical leadership. As a result, they gain more satisfaction (Freire & Bettencourt, 2020). It is important for leaders to follow moral virtues on regular basis. Moral characteristics are also very important for the leaders along with strategic power, knowledge and managerial expertise. The employee behavior is empowered by this moral aspect have impact on the satisfaction of the employee. Additionally, integration of moral principles is followed by ethical leaders that improves employee satisfaction (Demirtas, Hannah, Gok, Arslan, & Capar, 2017). Other recent studies have empirically supported the effect of ethical leadership on satisfaction in the context of sports. The outcomes of Arianpour and Jafari Kheirabadi (2019) reported positive relationship among ethical leadership and satisfaction among staff of the sports. Similar findings were also concluded by Guo (2022) who reported that employee satisfaction is enhanced through ethical leadership.

H6: Ethical leadership have significant impact on satisfaction.

H7: Satisfaction mediates the relationship among ethical leadership and effectiveness.

Online ISSN: 3006-8886
Print ISSN: 3006-8878

Self-efficacy: Relationship with Satisfaction

In literature, self-efficacy is defined as the confidence of a person that enables to execute and organize the set of required actions so the goals can be achieved (Laguna, 2013). It is referred to the belief of the individuals so they can exercise control over the direction and quality of work. This construct in literature is considered as one of the strongest predictors of different behaviours including satisfaction. Self-efficacy is conceptualized in terms of a person who is stable. In the situations of high pressure, the person with self-efficacy will not withdraw from the situation. This person will develop different action plans to solve the pressure situation. Different mechanisms will be developed to control the situation (Samuel & Burger, 2020). Moreover, anxiety, stress and emotions are better handled by these people.

A number of past studies have mentioned positive relationship among self-efficacy and satisfaction (Hampton et al., 2020; Machmud, 2018). Efficacious people try to solve different problems with problem solving techniques. They also try to be effective employee by managing emotions during failure situation. In context of sports, coaches with high level of self-efficacy try to inspire their followers which lead to greater level of satisfaction (Machida-Kosuga, Schaubroeck, & Feltz, 2016). The confidence level of people with high level of self-efficacy is more as compared to the one with low level of self-efficacy. They have belief that they have capability to solve different issues. Therefore, the satisfaction level of these people is very high. Also, person with high level of self-efficacy have ability to solve other related tasks as well in terms of the tasks they are already completing. Their frustration level is very low in their personal and professional lives. Thus, their satisfaction level is very high (Jhangiani & Tarry, 2022). Employees with high level of self-efficacy have positive feeling most of the times. They regularly take feedback and they also remain happier resulting in good mental health. All these factors contribute towards the positive effect of self-efficacy on satisfaction (Yu & Song, 2022).

H8: Self efficacy has significant effect on satisfaction.

H9: Satisfaction mediates the relationship between self-efficacy and effectiveness.

Figure 1: Theoretical Framework

Sampling Method and Procedure

Researcher collected data from employees of banks. The aim of current study is to examine the impact of emotional intelligence, customer orientation, ethical leadership, and self-efficacy on the team effectiveness. Furthermore, this study investigates the mediational role of satisfaction

Online ISSN: 3006-8886
Print ISSN: 3006-8878

between the effects of customer orientation, self-efficacy, ethical leadership, emotional intelligence, and the team effectiveness. Cross sectional research design was used for the collection of data. 260 questionnaires were distributed among the respondents Therefore; the target population of current study was employees of banks. The choice, anonymity, and confidentiality regarding the participation in the process of data collection were explained by the researcher. The simple random sampling technique was used for the collection of data. The questionnaire was composed of cover letter, briefing the purpose of the study, and providing assurance to the respondents that their identities will be revealed, and the data will be used only for academic purposes. The purpose of meetings was to brief the concept and basic idea of the study and ensure the confidentiality of data. Participants of survey completed the survey on voluntary basis. The respondents were asked to complete the survey at different locations to ensure that the response of one can't affect the response of the others. Consequently, survey provided the accurate results about the perceptions and choices of the respondents. The first section of the survey was about the demographic characteristics of the respondents. Second section composed of the items of the construct under study.

Data Analysis

Demographics

To analyse the data and the hypothesized relationships, it is very important to understand the basic characteristics of the data. For this purpose, researcher analysed the demographic characteristics of the respondents. Among the 208 valid responses the 62.5% were male and 35.5% were female. 25% respondents were of the age between 15 to 20 years. 19.2% were of the age between 20 to 25 years. 24% were of the age between 25 to 30 years while 29.8% were of the age above 30 years.

Table 1: Descriptive Statistics

Variable	groups	frequency	Percentage
Gender			
	Male	130	62.50%
	Female	78	37.50%
Age			
	15–20 years	50	24%
	20– 25 years	40	19.20%
	25–30 years	50	24%
	> 30 years	62	29.80%

Reliability and Validity

To test the reliability and validity of the data researcher conducted the confirmatory factor analysis. Researcher used the factor loading to calculate the reliability and the validity of the constructs. According to Hair, Harrison, and Risher (2018) factors must load higher than 0.60 to be included in the analysis. Table 2 shows that the loadings of all factors are greater than 0.60. Construct reliability is higher than the threshold level 0.70 and the validity of the data is greater than 0.50. Therefore, data is fit for further analysis (Hair Jr, Howard, & Nitzl, 2020).

Model Testing

Hypothesized model was tested with the help of process macro of Preacher and Hayes (2004). The results show significant positive effect of satisfaction on team effectiveness, supporting H1 of the study. From the table 4 given below it is evident that the emotional intelligence positively significantly effects the satisfaction, supporting H2 of the study and satisfaction significantly mediates the relationship between emotional intelligence and team effectiveness. Customer orientation positively and significantly effects the satisfaction. Thus, H4 of the study is supported. Whereas satisfaction significantly mediates the relationship between customer orientation and team effectiveness confirming H5. Ethical leadership positively significantly effects the satisfaction supporting H6 of the study, while satisfaction significantly mediates the relationship of ethical leadership and team effectiveness confirming H7. Self-efficacy significantly positively effects the satisfaction confirming H8 and satisfaction significantly mediates the relationship of self-efficacy and team effectiveness, supporting H9.

Discussion

This study was designed to examine the effect customer orientation and HRM factors such as self-efficacy, ethical leadership and emotional intelligence on satisfaction and team effectiveness. This research also examined the mediating role of satisfaction among proposed framework. The finding of the study supported positive relationship among satisfaction and effectiveness of the team. The possible reason for these findings is that the satisfied team players are committed to do anything to accomplish success. They are quite willing to go beyond normal routine to achieve organizational effectiveness and goals. Moreover, the commitment and

Online ISSN: 3006-8886
Print ISSN: 3006-8878

motivation level among the member who is satisfied is high. The attitude of the employee is shaped into positive attitude that is key to improve effectiveness of team members. The performance of the employee is satisfied is consistent that enhance the effectiveness of individual team members and overall team as well. The level of stress and anxiety among the satisfied members is low creating positive relationship with effectiveness. These findings are similar to the findings of S. DeOrtentiis et al. (2013) who also reported positive effect of satisfaction in effectivity of the employee.

The findings of the study also revealed that emotional intelligence is the key antecedent of effectiveness of the employee. In past, similar results were reported by Jung and Yoon (2016); (Sabahi & Dashti, 2016) who mentioned that satisfaction is developed within an individual because of emotional intelligence. The person who is emotionally stable take important decisions wisely. Such employees have very good understanding of their own behavior. They know when and how to behave. Such behavioral control helps in achieving desired goals easily. The employees who have emotional control have understanding when they are happy or sad. The reason for these findings is that the respondents of the study are have good sense of feelings about the work they are doing. Moreover, emotional intelligence develop the capacity of empathy and stress management as well. On the other hand, they have ability to resolve conflicts in better way which leads to positive effect on their level of satisfaction.

Customer orientation positively influences employee satisfaction because it creates a work environment in which employees understand the importance of meeting customer expectations and delivering quality services. When organizations prioritize customer needs, employees receive clearer directions regarding their responsibilities and become more involved in improving service delivery. Moreover, customer-oriented organizations encourage employees to develop customer-related knowledge and skills through effective training and information sharing. This enables employees to perform their duties more confidently, reduces difficulties in handling customer complaints, and creates a sense of achievement. Consequently, employees develop more positive attitudes towards their jobs, resulting in higher employee satisfaction.

Additionally, leaderhsip has proven to be signficant impactor of satisfaction. The top management and decision makers plays key role in the fate of the employee. They encourage other employees to perform well. They also show the followers the right way by which they can complete their goals. When leaders keep in view the norms and values of the team, the players are also willing to put extra effort in their job. The employees are also happy to report the problems that they are facing in their assigned tasks. The findings of these studies are inline with the results of Arianpour and Jafari Kheirabadi (2019) who also reported positive effect of ethical leadership on satisfaction.

On the other hand, findings also supported the hypothesis that self-efficacy have positive effect on satisfaction. This findings is inline with the outcome of Yu and Song (2022) who showed positive impact of self-efficacy on satisfaction. There are a number of different reasons for which this result is reported in present study. Actually, self-efficacy plays integral role to create confidence among employees regarding accomplishment of tasks and assigned goals. Therefore, the respondents of the study are of the view that they are confident enough that they will be able to accomplish their tasks. It is one of the sole factors having influence of the satisfaction of the employees. In the end, sense of enjoyment is developed in a player because of self-efficacy. The

Online ISSN: 3006-8886
Print ISSN: 3006-8878

results of the study also supported the mediating effect of satisfaction among self-efficacy, ethical leadership, customer orientation, emotional intelligence and team effectiveness.
